Variable Selection and Task Grouping for Multi-Task Learning

2018, 11, 30

Jun-Yong Jeong and Chi-Hyuck Jun Industrial and Management Engineering, POSTECH

Introduction

Multi-task learning

- Multiple related output variables (=Task)
- Different observations for each output variable

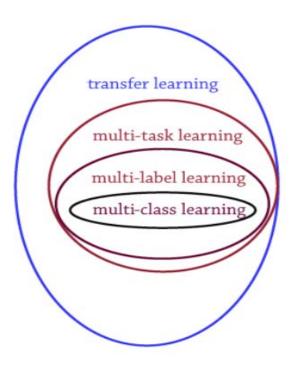

Input variables		Output variables (=Tasks)			
<i>X</i> ₁		X_D	<i>Y</i> ₁	•••	Y_T
2		40	10		?
3		23	20		11
4		100	?		15
1.5		10	?		9
2		53	17		?

Introduction

Multi-task learning

Relationship to other problems
 (figure from Zhou et al., 2012)

o Transfer Learning

- Define source & target domains
- Learn on the source domain
- Generalize on the target domain

Multi-task Learning

- Model the task relatedness
- Learn all tasks simultaneously
- Tasks may have different data/features

Multi-label Learning

- Model the label relatedness
- Learn all labels simultaneously
- Labels share the same data/features

o Multi-class Learning

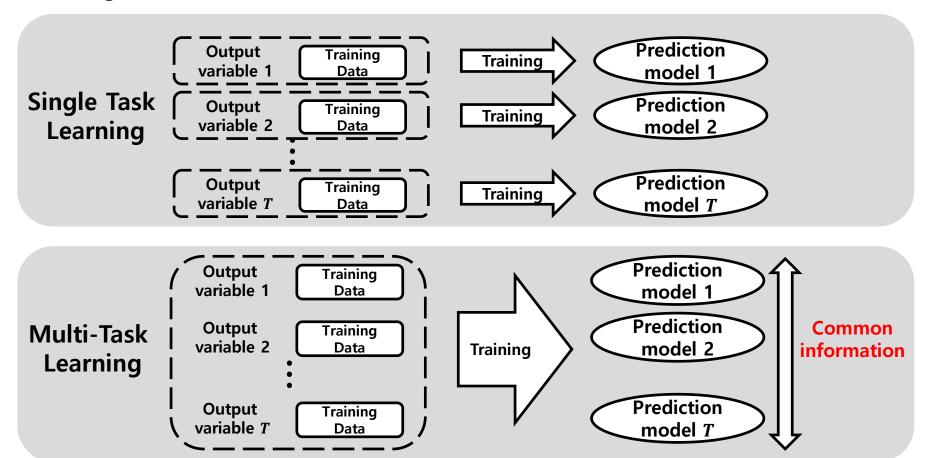

- Learn the classes independently
- All classes are exclusive

Introduction

Multi-task learning

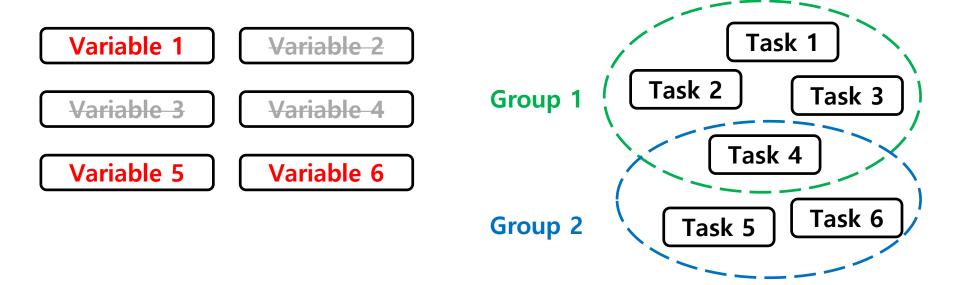

• Simlutaneous learning to share common information among prediction models (figure from Zhou et al., 2012)

Problem and Purpose

- Multi-task regression/classification
- *T* tasks (=output) and *D* input variables

Main idea

- Linear model
- Low-rank factorization & Sparsity

$$\mathbf{W} = \mathbf{U}\mathbf{V} \in \mathbb{R}^{D \times T}$$

$$\mathbf{U} \in \mathbb{R}^{D \times M}$$
 and $\mathbf{V} \in \mathbb{R}^{M \times T}$

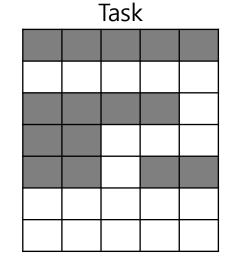

Coefficient matrix W

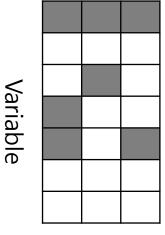

Latent

Variable-latent matrix U

Latent-task matrix V

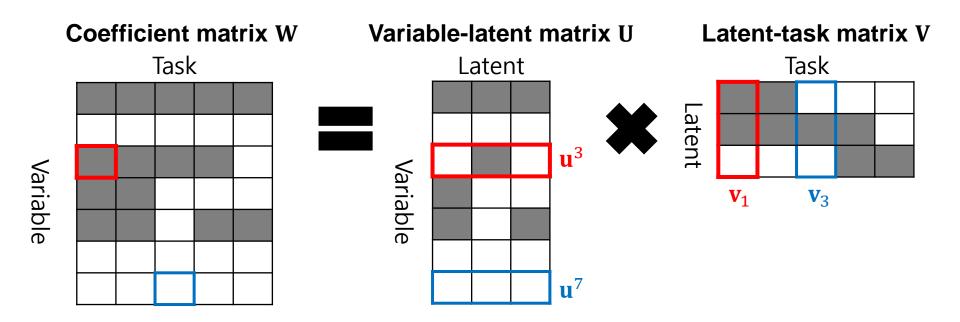

Task

Variable selection

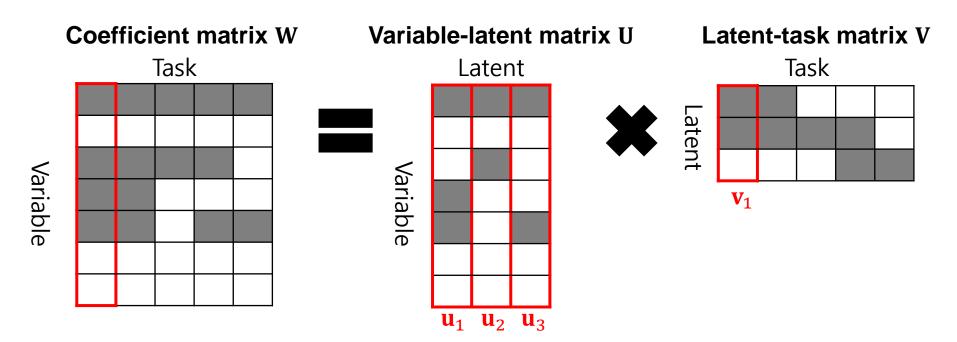

- Coefficient of *i*th variable for *j*th task $w_{ij} = \mathbf{u}^i \mathbf{v}_j \in \mathbb{R} (\mathbf{u}^i \in \mathbb{R}^{1 \times M} \& \mathbf{v}_j \in \mathbb{R}^M)$
- \Rightarrow Impose sparsities between and within the rows of Variable-latent matrix \mathbf{U} (Chen and Huang, 2012)

Task grouping

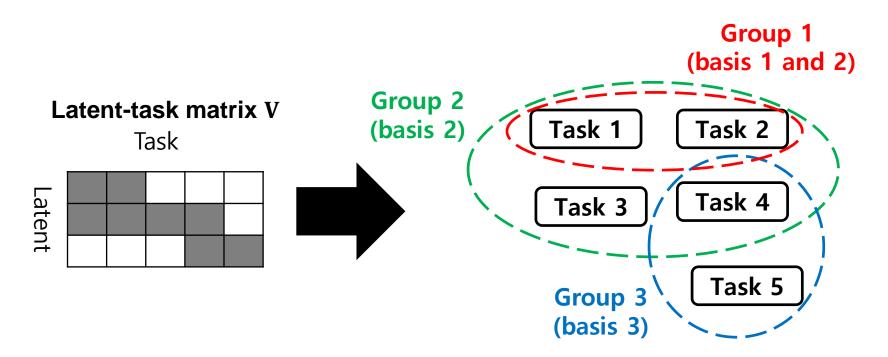

- Coefficient vector for jth task $\mathbf{w}_j = \mathbf{U}\mathbf{v}_j = \sum_{m=1}^M v_{mj}\mathbf{u}_m \in \mathbb{R}^D$
- \Rightarrow Task grouping by dependency on the basis vectors \mathbf{u}_m
- \Rightarrow Impose sparsity within the columns of Latent-task matrix **V** (Kumar and Daume, 2012)

Task grouping

- Coefficient vector for jth task $\mathbf{w}_j = \mathbf{U}\mathbf{v}_j = \sum_{m=1}^M v_{mj}\mathbf{u}_m \in \mathbb{R}^D$
- \Rightarrow Task grouping by dependency on the basis vectors \mathbf{u}_m
- \Rightarrow Impose sparsity within the columns of Latent-task matrix **V** (Kumar and Daume, 2012)

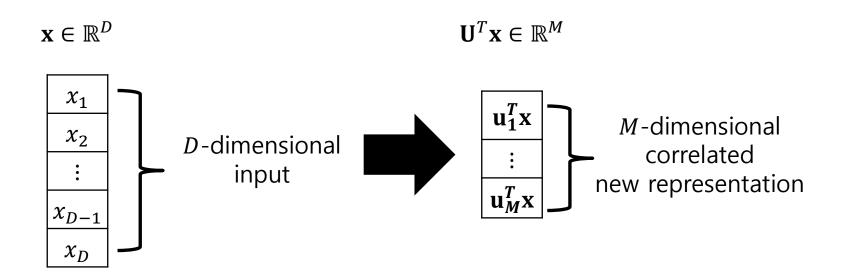

Task grouping

Representation learning

$$\hat{y}_j(\mathbf{x}) = (\mathbf{w}_j)^T \mathbf{x} = \mathbf{v}_j^T \mathbf{U}^T \mathbf{x} = \mathbf{v}_j^T (\mathbf{U}^T \mathbf{x})$$

 \mathbf{U}^T : a linear transform from \mathbb{R}^D to \mathbb{R}^M

 $\mathbf{v}_j \in \mathbb{R}^M$: a coefficient vector in a new correlated representation

Optimization problem

$$\min_{\mathbf{U},\mathbf{V}} \sum_{j=1}^{T} \frac{1}{N_{j}} L(y_{j}, \mathbf{X}_{j} \mathbf{U} \mathbf{v}_{j})$$

$$s. t$$

$$\mathbf{C1}: \| \mathbf{U} \|_{1} = \sum_{i=1}^{D} \| \mathbf{u}^{i} \|_{1} \leq \alpha_{1},$$

$$\mathbf{C2}: \| \mathbf{U} \|_{1,\infty} = \sum_{i=1}^{D} \| \mathbf{u}^{i} \|_{\infty} \leq \alpha_{2},$$

C3:
$$\sum_{j=1}^{T} (\|\mathbf{v}_j\|_k^{sp})^2 \leq \beta$$

$$\min_{\mathbf{U},\mathbf{V}} \sum_{j=1}^{T} \frac{1}{N_{j}} L(y_{j}, \mathbf{X}_{j} \mathbf{U} \mathbf{v}_{j})$$

$$+ \gamma_{1} \parallel \mathbf{U} \parallel_{1} + \gamma_{2} \parallel \mathbf{U} \parallel_{1,\infty}$$

$$+ \mu \sum_{j=1}^{T} (\parallel \mathbf{v}_{j} \parallel_{k}^{sp})^{2}$$

C1 & C2: L1,1 & L1,inf norm

- \Rightarrow impose sparsities between and within the row vector \mathbf{u}^i
- ⇒ perform variable selection

C3: Squared k-support norm (Argyriou et al., 2012)

- \Rightarrow impose sparsity within the column vector \mathbf{v}_i while considering correlation
- ⇒ perform task grouping

Optimization procedure

Initialization based on single-task learning

1. Learn a ridge regression for each task to compute initial coefficient vector

$$\mathbf{w}_{j}^{init} := \underset{\mathbf{w}}{\operatorname{argmin}} \frac{1}{N_{j}} L(\mathbf{y}_{j}, \mathbf{X}_{j} \mathbf{w}) + \sqrt{\gamma_{1}^{2} + \gamma_{2}^{2} + \mu^{2}} \parallel \mathbf{w} \parallel_{2}^{2}$$
$$\mathbf{W}^{init} := \left[\mathbf{w}_{1}^{init}, \dots, \mathbf{w}_{T}^{init}\right] \in \mathbb{R}^{D \times T}$$

2. Compute the top-M left singular vectors, the top-M right singular vectors and the top-M singular value matrix and estimate initial values

$$\mathbf{W}^{init} = \mathbf{P} \mathbf{\Sigma} \mathbf{Q}^T, \mathbf{P} \in \mathbb{R}^{D \times M}, \mathbf{\Sigma} \in \mathbb{R}^{M \times M}, \mathbf{Q} \in \mathbb{R}^{T \times M}$$
$$\mathbf{U} = \mathbf{P} \mathbf{\Sigma}^{1/2} \ \& \ \mathbf{V} = \mathbf{\Sigma}^{1/2} \mathbf{Q}^T$$

Alternating optimization

- 3. Repeat until convergence
- Update U with an ADMM and an early stopping

$$\min_{\mathbf{U}, \mathbf{Z}_1, \mathbf{Z}_2, \mathbf{Z}_3} \sum_{j=1}^{T} \frac{1}{N_j} L(y_j, \mathbf{X}_j \mathbf{Z}_1 \mathbf{v}_j) + \gamma_1 \parallel \mathbf{Z}_2 \parallel_1 + \gamma_2 \parallel \mathbf{Z}_3 \parallel_{1,\infty}$$

$$s. t \mathbf{A}\mathbf{U} + \mathbf{B}\mathbf{Z} = \mathbf{0},$$

where
$$\mathbf{A} = \begin{bmatrix} \mathbf{I}_D \\ \mathbf{I}_D \\ \mathbf{I}_D \end{bmatrix}$$
, $\mathbf{B} = diag(-\mathbf{I}_D, -\mathbf{I}_D, -\mathbf{I}_D)$, and $\mathbf{Z} = \begin{bmatrix} \mathbf{Z}_1 \\ \mathbf{Z}_2 \\ \mathbf{Z}_3 \end{bmatrix}$

5. For j = 1, ..., T, update \mathbf{v}_j by solving a k-support norm regularized regression or logistic regression with an accelerated proximal gradient descent

$$\min_{\mathbf{v}} \frac{1}{N_j} L(\mathbf{y}_j, (\mathbf{X}_j \mathbf{U}) \mathbf{v}) + \mu (\| \mathbf{v} \|_k^{sp})^2$$

6. End Repeat

Theoretical analysis

Upper bound on the excess error

If $\alpha_1^2 \leq M$, with probability at least $1 - \delta$ the excess error is bounded by

$$\frac{1}{T} \sum_{j=1}^{T} \mathbb{E} \left[L'(\mathbf{y}_j, \mathbf{X}_j \widehat{\mathbf{U}} \widehat{\mathbf{v}}_j) \right] - \min_{\mathbf{U} \in \mathcal{H}, \mathbf{v}_j \in \mathcal{F}} \frac{1}{T} \sum_{j=1}^{T} \mathbb{E} \left[L'(\mathbf{y}_j, \mathbf{X}_j \mathbf{U} \mathbf{v}_j) \right]$$

$$\leq c_1 \beta M \sqrt{\frac{\|\hat{C}(\overline{\mathbf{X}})\|_1}{NT}} + c_2 \beta \sqrt{\frac{\|\hat{C}(\overline{\mathbf{X}})\|_{\infty}}{N}} + \sqrt{\frac{8 \ln(\frac{2}{\delta})}{NT}}$$

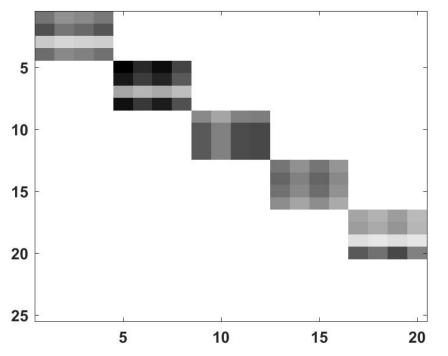

Where L' is the scaled loss function, $\widehat{\mathbf{U}}$, $\widehat{\mathbf{v}}_1$, ... $\widehat{\mathbf{v}}_T$ are the optimal solution, $\|\widehat{\mathcal{C}}(\overline{\mathbf{X}})\|_1 = \frac{1}{T}\sum_{j=1}^T tr\left(\widehat{\Sigma}(\mathbf{X}_j)\right)$, $\|\widehat{\mathcal{C}}(\overline{\mathbf{X}})\|_{\infty} = \frac{1}{T}\sum_{j=1}^T \lambda_{max}\left(\widehat{\Sigma}(\mathbf{X}_j)\right)$, and $\widehat{\Sigma}(\mathbf{X}_j)$ is the empirical covariance of \mathbf{X}_i

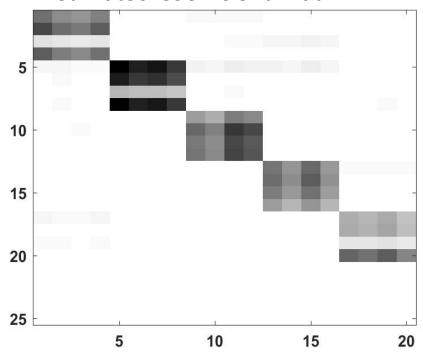

Simulation study

- True model: $\mathbf{W}^* = \mathbf{U}^* \mathbf{V}^* \in \mathbb{R}^{25 \times 20} \ \& \ y_j = \mathbf{x}^T \mathbf{w}_j^* + N(0,1)$
- Case 1. No correlation & disjoint group

Estimated coefficient matrix $\hat{\mathbf{W}}$

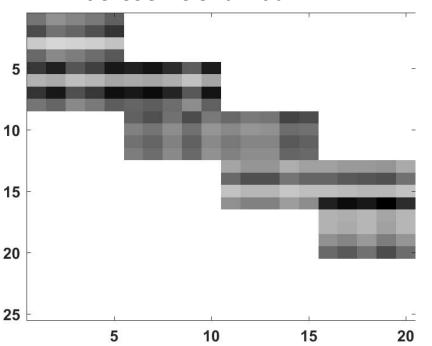

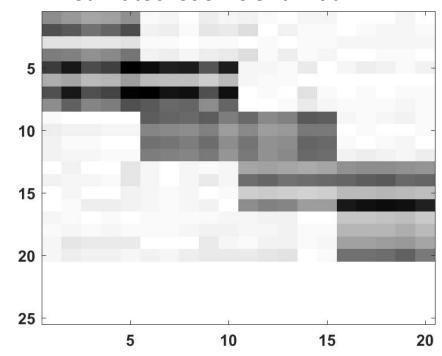

Simulation study

- True model: $\mathbf{W}^* = \mathbf{U}^* \mathbf{V}^* \in \mathbb{R}^{25 \times 20} \ \& \ y_j = \mathbf{x}^T \mathbf{w}_j^* + N(0,1)$
- Case 2. No correlation & overlapping group

True coefficient matrix W*

Estimated coefficient matrix $\hat{\mathbf{W}}$

Conclusion

Summary

- Linear model for multi-task regression and classification
- Variable selection and Task grouping
- Lower bound on the excess error

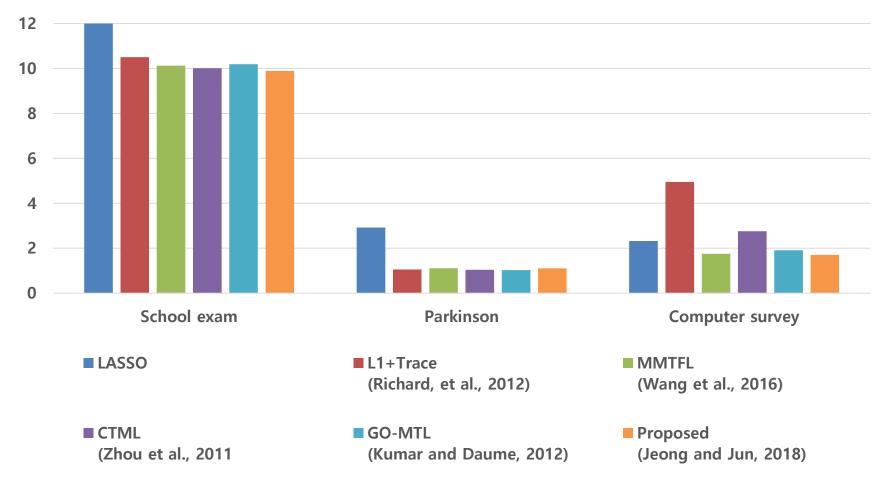

Future work

- Slow convergence rate of ADMM $O(1/\epsilon)$
- ⇒ Apply a proximal alternating linearized minimization (Bolte et al., 2014)
- & Compute a proximal operator of $\ell_1 + \ell_\infty$ norm

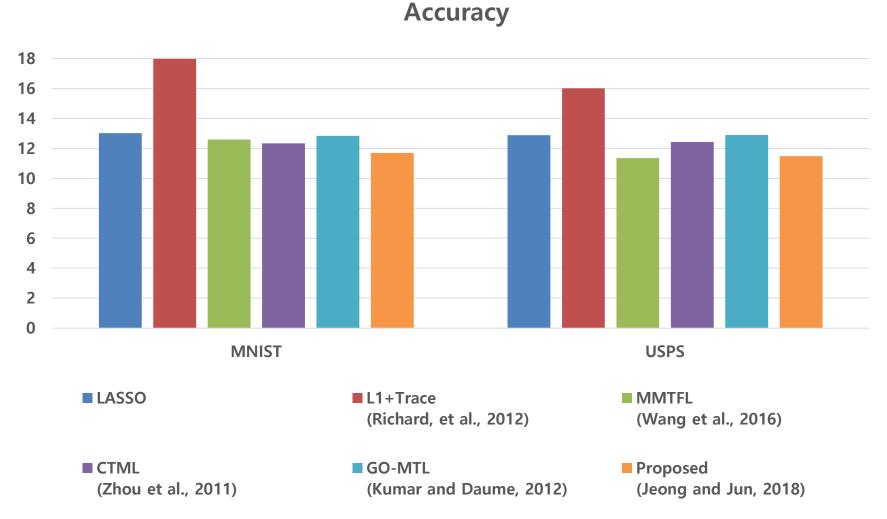

Benchmark datasets – Regression

Root mean squared error

Benchmark datasets – Classification
